

Kamilimu cohort 10- session 9

Applying ICT Skills to Your Innovation Project

TODAY

1

Connect what you've learned to your project

2

Identify where security fits into your solution

3

Think about risks and how to address them

4

Get feedback to improve your implementation

5

Examples of previous cohorts innovation

What Can You Take From the Track?

Don't list every session — group what you've learned into four areas.

Understand

- How systems and networks work
- How applications communicate

Build

- Apply technical concepts to develop solutions
- Make better technical decisions

Secure

- Think like an attacker
- Identify risks and weaknesses
- Put appropriate security controls in place

Monitor & Respond

- Know what to monitor
- Recognize suspicious activity
- Have a plan when something goes wrong

Look at Your Project Differently

Ask yourself these questions about your innovation project, in order.

1 What are we building?

2 What does the system need?

3 What could go wrong?

4 How can we protect it?

5 How will we know when something goes wrong?

6 How will we respond?

Example: Applying the Learning

Imagine your team is building a platform that allows users to make payments.
Instead of only asking *"Does the payment function work?"* — think:

Question	Application
Who can access it?	Authentication & access control
How does the application communicate?	Networking & secure protocols
What could an attacker exploit?	Offensive security
What information are we protecting?	Risk & security controls
What should we record?	Logging & monitoring
What if an account is compromised?	Incident response
What threats should we be aware of?	Threat intelligence

Your Turn: Secure Your Innovation

In your teams, discuss:

1

What are the important assets in our project?

2

What are the biggest risks or threats?

3

What security measures should we implement?

4

What should we monitor?

5

What would we do if something goes wrong?

DELIVERABLE

Each team should produce a simple security/technical implementation plan for their innovation project.

Your project should not only solve a problem. It should also be:

From Idea to Implementation

Practical

Can we actually implement it?

Secure

Can we protect it?

Reliable

Can users depend on it?

Monitorable

Can we see what's happening?

Resilient

Can we recover when something goes wrong?

FORTRESS

STAYING AHEAD
